

Substantially implemented business software

A functional local-first desktop platform for small businesses. The application is no longer an early prototype or UI scaffold; it is now in active development, validation and hardening.

Development Audit Snapshot - September 2026

90.0%

Functional Implementation Completeness

81.8%

ERP Local V1 Trial Readiness

50.8%

Commercial / Greek Production Release Readiness

Serious controlled Local-v1 trial threshold: 88.0% | Current trial readiness: 81.8% | Distance: 6.3 percentage points

These are distinct audit dimensions. They are not certification and do not represent production, commercial, compliance or release approval.

Evidence-weighted repository audit

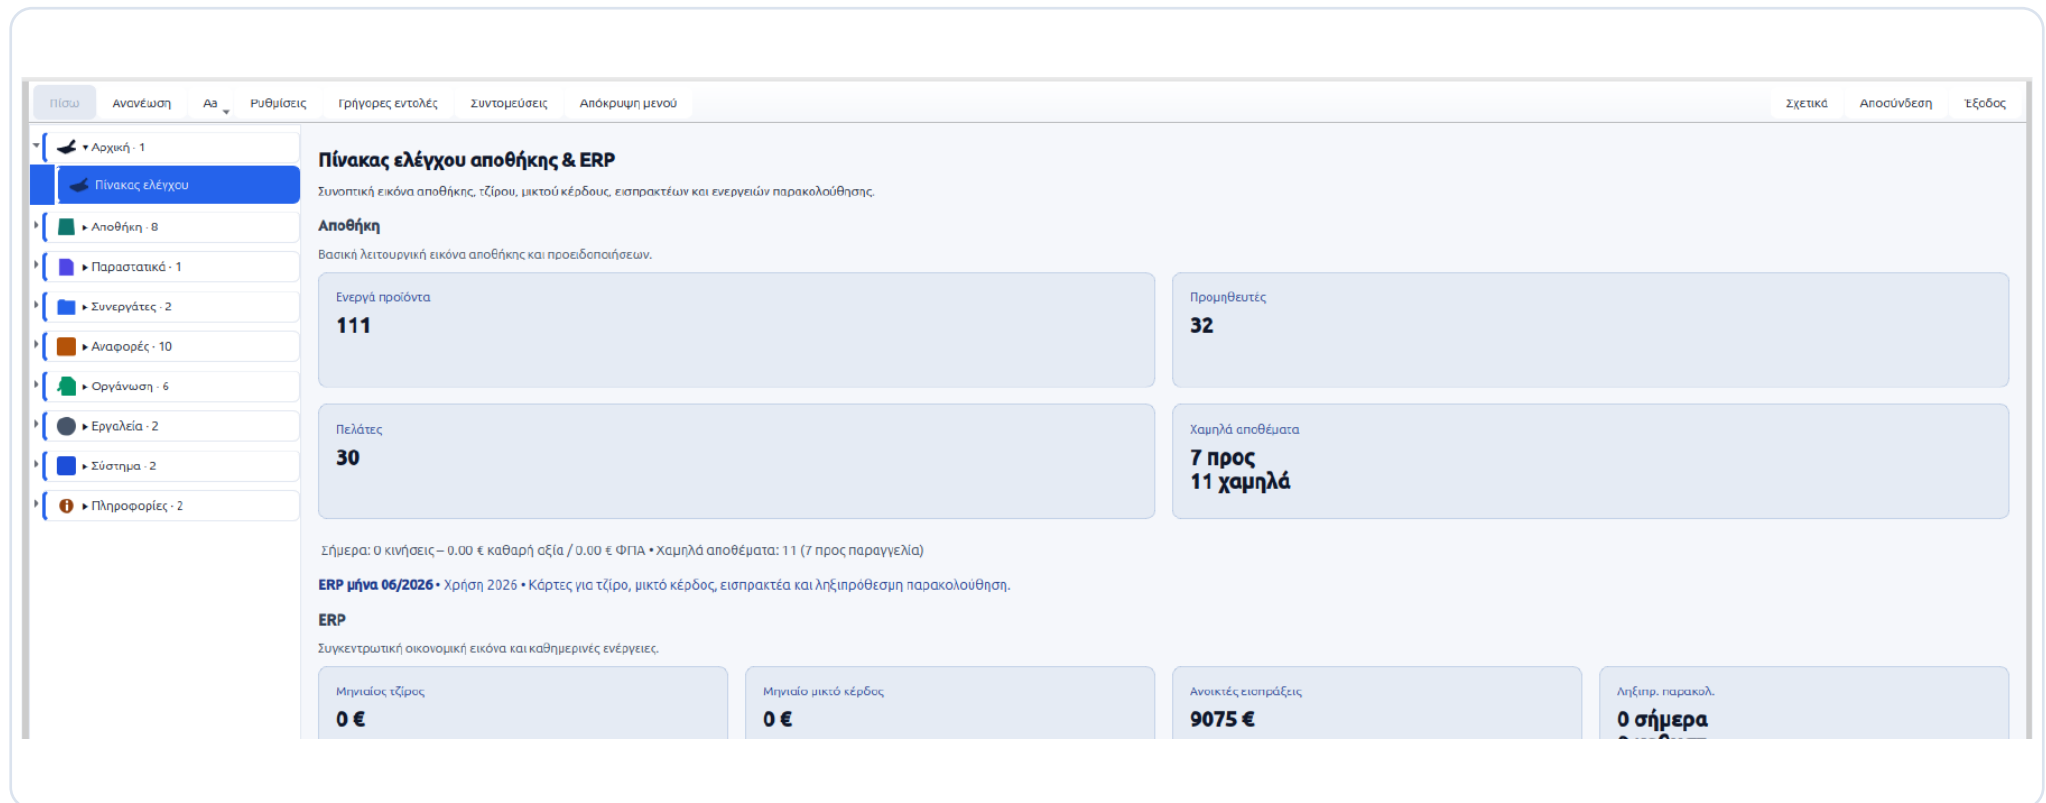

- 20 weighted Local ERP capability groups assessed
- 0 MISSING, 0 BLOCKED, 0 UNKNOWN within the audited Local ERP scope
- 4,070 pytest cases collected by the automated regression suite
- Real service/business layer; core Local ERP functionality materially implemented

Current positioning

- Not a prototype anymore
- Not production-ready yet
- Not yet declared ready for serious controlled Local-v1 trial use
- No commercial-release or Greek production-compliance claim
- Active focus: validation, integrity controls, hardening and end-to-end / recovery proof

Development priority: Security & data integrity first | Usability second | Functionality third

Current Application Preview

Business Dashboard - current development build

Real application screen using demo data. The dashboard exposes warehouse and business activity, including products, suppliers, customers, low-stock information, balances and follow-up-oriented views.

CRM direction - current

Customer-oriented views, open balances and follow-up workflows form an early CRM-related foundation. This is not presented as a complete CRM.

Validation philosophy

Testing is a core engineering control. The automated regression suite collects more than 4,000 pytest cases; collection count alone is not a pass or readiness claim.

Products & Inventory

The current desktop application includes real warehouse and inventory workflows using demo data: product records, SKU codes, categories, suppliers, stock quantities, pricing and VAT information.

Validated / strong foundations

- Inventory receiving, issuing and transfers
- Negative-stock protection
- Stock / warehouse schema
- Operational reports and reconciliation foundations

Still under validation / hardening

- Cross-domain DB business-consistency diagnostics
- Final money-precision / persistence policy
- Full accepted operational - reopen - backup/restore - reconciliation proof

Business Documents & Readiness Boundaries

Current validation gates

- Consistent explicit service-layer authorization
- Final money-precision and persistence policy
- Cross-domain DB business-consistency diagnostics
- Returns / refunds boundary or implementation
- One accepted full operational + reopen + backup/restore + reconciliation sequence

Business document workflow

Real development-build preview using demo data. Document creation, numbering, calculations, posting, posted-document immutability, stock effects, payments, receipts, credit offsets and overpayment controls are among the stronger current foundations.

Longer-term roadmap and explicit non-claims

- Broader dedicated CRM and deeper e-shop integration remain future direction.
- Server/API, PostgreSQL, true multi-writer operation and Cloud/SaaS are future architecture only - no current readiness claim.
- The software is not presented as production-ready, commercially released, Greek production compliant or serious controlled Local-v1 trial ready.
- Current local-first deployment direction remains the supported architecture while validation and hardening continue.
